

Deliverable 1

Features we implemented so far

Our primary focus for Deliverable 1 is the implementation of the front-end user interfaces for the students in the Smart Course Companion. A user can create and manage an account and add classes that the user is registered for by writing his class code, names, instructors, and terms. Students can also view their assessments, like assignments, labs, quizzes, and exams, related to their classes.

Additionally, we developed interfaces/UIs that allow students to view their marks and total marks for their assessments and view their current average for their courses. We have also built a general dashboard for students to view incoming assessments for all their classes on a single page and see their assessments as *complete*, *pending* or *coming up*.

Users can also make changes or even delete the classes and assessments they created. We have included visual components such as progress bars and icons to assist the students in tracking their progress throughout the semester when clicking on the Course info or the main dashboard.

For the admin functionality, we built a front-end user interface that will allow them to build, create and manage classes, develop assessment categories and their weighting and view anonymous usage statistics for the application. Admins can also turn on/off classes.
