Teamwork Discussion Sheet

Project

Student name	Student ID	Items covered	Contribution on each item (%)	Overall Contribution on the deliverable (%)*	Signature
Ryan Takka	40329851	Student courses details (assessments, grades etc. functionality),list of features that have been implemented.	100%	25%	RT
Axelle Mmandoa	40297179	Student Dashboard(front and backend), the backend features to be implemented.	100%	25%	AM

Kimia Karimi yeganeh	40068588	Log in/sign up system, navigation, installation guide	100%	25%	KK
Dory Saint-Surin	40333752	Admin panels, admin statistics, routes, middleware, user guide	100%	25%	DJS

** The sum of ratios in this column should sum to 100%*

Discussion:

Please write a small paragraph discussing teamwork (who did what, how much, was the work allocation fair, did each member respect commitments and deadlines...)

Deliverable 1

To guarantee that every component of the system was built effectively, the project work was split among the four team members. Kimia was in charge of putting the website's general design and authentication system into place. Axelle worked on the Student Dashboard, which has the calendar showing assessment deadlines, average grade computations, and course progress visualization. Students can examine course details and associated assessments thanks to Ryan's implementation of the student course, assessment (Admin and student version) and grades (Admin and student) pages. The Admin Panel, created by Dory, enables administrators or instructors to oversee classes and tests. Ryan created the list of features that have been implemented, Axelle described the backend features that would be included in the next deliverable, Kimia produced the installation guide, and Dory created the user guide for the documentation tasks. All participants accomplished their allocated responsibilities, adhered to project deadlines, and contributed to the final product. Overall, the effort was spread equitably among all members.

Deliverable 2

The student Dashboard backend takes course and assessment data from MongoDB, computes progress and grade information on the server side, and exposes API routes that the dashboard frontend uses to render the summary, snapshot, courses, and calendar. Kimia developed the authentication system, including login, signup, account types, and role-based navigation (ex. if a student tries to access the admin pages, the student gets redirected to the dashboard), and wrote the installation guide. Axelle did the frontend and backend of the student dashboard which has a calendar for upcoming deadlines, grade averages and course progress, and she wrote the features to be implemented. Ryan developed the student course details, including assessments, grades, and related functionality, and documented implemented features. Dory worked on the frontend and the backend of the admin parts of the website (managing courses, grades, assessments, and statistics), and wrote the user guide for the documentation tasks. All participants accomplished their allocated responsibilities, adhered to project deadlines, attended to team meetings and contributed to the final product. Overall, the effort was spread equitably among all members.
